MSP Report Builder

User Guide · November 2026

Day-to-day usage: generating a report, understanding each section, and troubleshooting.

1. What This Tool Does

The MSP Report Builder makes a monthly IT health report for the Microsoft 365 and Intune tenant of a client. It reads live data from Microsoft: device compliance, security posture, patch status, user activity and SharePoint usage. The report shows on screen. You can print it to PDF, or export it as a Word document for the client.

This guide explains the daily use of the report builder. To set up a new client tenant, refer to the separate Setup Guide. The Setup Guide explains the Microsoft Entra ID app registration steps.

2. Before You Start

Each client tenant needs a one-time setup before you can use it with the report builder. The setup is an app registration in the Microsoft Entra ID of the client, with 12 read-only permissions. Do the setup one time for each client. Refer to the Setup Guide for the steps.

After the setup, you have three values for the client. Keep them in a safe place, for example a password manager:

- Tenant ID
- Client ID
- Client Secret

3. Generating a Report

Step 1 — Open the report builder

Go to https://integricitymsp.netlify.app in a modern browser. A sign-in box shows the first time you open the page, and again after 8 hours. Click Sign in with Microsoft. Use your Integricity account. Your name and a Sign out button then show at the top right. Guest accounts and accounts outside Integricity cannot sign in.

Step 2 — Enter or select credentials

Choose a saved client from the list. Or enter a new Tenant ID, Client ID and Client Secret, and a client label.

To change a saved client, click the pencil icon on its button. Make the change and save it. Do this after you renew an expired secret. To remove a client, click the bin icon and confirm.

The browser keeps saved clients on this device until you delete them. Integricity servers never store them. Use only a device that you trust.

To remove the overseas sign-in section from a client report, tick Skip the overseas sign-in check for this client. Use this when all users work through a VPN, or when the check has no value.

Step 3 — Set the report period

Enter the From and To dates for the report period. This is usually one calendar month. Enter the name of the account manager. The dates default to the last full calendar month.

Tick One-off report only for a single engagement that does not repeat, for example a snapshot for a prospect. The app does not save the summary figures of the report for month-on-month comparison. It also deletes the figures that the app saved before for that tenant. Leave the box unticked for clients that you report on each month.

Step 4 — Pull data

Click Pull Intune data. The app calls Microsoft Graph and gets all metrics. This takes 3 to 8 seconds for most tenants. A large tenant takes more time. The app then builds the report and shows it. There is no separate review step.

Step 5 — View the full report

The full report shows on screen. The sections are in this order:

- Executive Summary (omitted, see below)
- Month-on-Month Changes (when available)
- Device & Asset Management
- Security Posture
- Patch Status
- User Data
- SharePoint / MS Teams
- Ticketing & Support (omitted, see below)
- Recommendations & Opportunities (omitted, see below)
- Security Risk Register

The wizard does not collect the data for Executive Summary, Ticketing & Support, and Recommendations & Opportunities. These are manual-entry sections, so the report leaves them out.

A collapsed Diagnostics panel shows above the report. It is not part of the report or its exports. The panel shows the raw SharePoint template values and the list of sites that the report counts as Other. It has a CSV download for that list.

The Diagnostics panel also shows the at-risk accounts and the result of the sign-in log query. For licences, it shows the term length that the report used for each renewal. It shows how many partner role assignments the report ignored. For non-compliant devices, it shows how many reasons the app found.

These buttons are on the page: Print / Save as PDF, Export to Word, Copy text, Edit inputs and New report. Copy text copies the report as plain text.

A one-off report has a short disclaimer on the cover. The disclaimer says that the report is a point-in-time automated summary and not a security audit. It also states that Integricity keeps no data. Regular client reports do not have the disclaimer.

Step 6 — Export

To make a Word file, click Export to Word. To make a PDF, click Print / Save as PDF, or press Ctrl+P (Cmd+P on a Mac). Then choose Save as PDF.

The app fills in the file name for you: [Company Name] - IT Report - [Month] [Year]. For example: Tax Management New Zealand Limited - IT Report - October 2026. The month and year come from the From date.

The app replaces characters that Windows does not allow in file names with a space. You can change the name before you save the file.

4. Understanding the Report Sections

Executive Summary

This section is a narrative overview of the month. It uses manual comment fields. The wizard does not collect these fields, so the report leaves this section out.

Month-on-Month Changes

This section lists what changed since last month. Examples are total and compliant devices, Secure Score, risky or inactive users, admin role holders and SharePoint storage. Each line compares this report with the saved figures from the previous calendar month. The saved figures are for the same tenant. The section lists only changes above a small limit.

The section shows automatically. It does not show on the first report of a tenant, when the previous month was not run, or when One-off report is ticked.

Device & Asset Management

This section shows the operating system breakdown, compliance status, encryption, antivirus, low disk space and stale devices. A stale device did not check in for 90 or more days.

The report lists non-compliant and unencrypted devices one by one, with the assigned user. Each non-compliant device shows the reason for the failure. The reason names the compliance policy that the device fails. Where Intune gives the detail, it also names the failed settings, for example Require BitLocker. If the reason shows Not available, Intune did not return it for that device.

The report lists every Windows 10 device with its full version. The version has the release, the patch month and the build number, for example Win 10 22H2 - 10.0.19045.6456.

The compliance percentage counts only the devices that Intune evaluated. The formula is compliant divided by compliant plus non-compliant. Devices that Intune did not evaluate are not in the count. The ring is green at 80% or more, orange at 60% to 79% and red below 60%.

The lists have a fixed order. Non-compliant and unencrypted devices are in machine-name order. Low-disk devices show with the least free space first. Devices that did not check in for 90 or more days show with the longest absence first.

Security Posture

This section shows the Microsoft Secure Score, the status of the Conditional Access policies and the authentication methods in use. It also shows the risky user accounts that Entra ID Protection flags.

Patch Status

This section groups devices by the patch level of Windows: current, 30 or more days behind, or 90 or more days behind. The app uses the last Intune check-in.

User Data

This section shows the total licensed users, shared mailboxes and guest accounts. It also shows inactive accounts (90 or more days), admin role holders, unexpected overseas sign-ins and licence assignment.

The licence list shows paid licences first, with the largest estimated cost first. Free licences follow. A licence with the word trial in its name counts as free. A licence bar is red only when more licences are assigned than purchased. It is blue at exactly 100% and orange at 90% or more. A licence with no purchased units shows n / n.

Upcoming licence renewals lists every active Microsoft subscription that renews in the next 90 days. Each row shows the seat count, the renewal date and a Billing label. The label is Monthly or Annual / multi-year. Microsoft does not give the billing frequency, so the report works it out from the dates of the subscription. The report shows Annual only when the dates clearly show a yearly term. It shows all other licences as Monthly.

Use the label as a guide. For a licence where billing is important, check the Microsoft 365 admin centre. If no renewal is due, the report says so. If the app cannot read the Microsoft data, the report says that.

Unexpected overseas sign-ins are successful interactive sign-ins from outside Australia, New Zealand and Malaysia. If five or more different people use the same overseas IP address, the report leaves it out and notes it. This is typically a company VPN or gateway. If the app cannot read the full sign-in log, the report says how many days it checked. Microsoft keeps sign-in logs for only 30 days (7 days on free tenants). The app cannot get older sign-ins.

Admin role holders are the administrators that belong to the client. The report leaves out access that the service provider holds through Microsoft 365 Lighthouse or GDAP. This access uses the groups of the partner. The Diagnostics panel shows how many such assignments the report ignored.

SharePoint / MS Teams

This section shows the total sites and a breakdown by type. The types are M365 Group sites, Communication sites and Teams channels. Classic sites and Other show only when there are some.

M365 Group sites are sites that Microsoft 365 Groups create, with the sites behind Teams. Teams channels are the hidden sites behind private and shared channels. Classic sites are older-style team sites. Other is tenant system sites and anything that the app does not recognise.

The section also shows the storage used, the Inactive Sites and Channels 180 days + count and the Security Group count. An inactive site has no recorded activity for 180 or more days. A warning note shows when there are any.

The report leaves placeholder entries in the Microsoft report out of all counts. A placeholder has no template, no recorded activity and less than 0.05 GB.

These figures come from the usage reports of Microsoft. The reports are 24 to 48 hours behind and include hidden channel and system sites. For this reason, the total is normally higher than the Active sites list in the SharePoint admin center.

The collapsed Diagnostics panel above the report shows the raw template values that Microsoft returned. It shows the type that the app counted for each value. Use it to check a number that looks wrong. It is not part of the exported report.

Ticketing & Support

This section shows the support ticket counts (opened, closed, pending), the average response and resolution times and any P1 incident for the period. These are manual-entry fields. The wizard does not collect them, so the report leaves this section out.

Recommendations & Opportunities

This section has a personal note, suggested improvements, opportunities to save cost and tech roadmap items. These are manual-entry fields. The wizard does not collect them, so the report leaves this section out.

Security Risk Register

The app makes this section from the data in the other sections. Each finding above a threshold shows here, for example unencrypted devices or a low Secure Score. Each finding has a rank of High, Medium or Low and a recommended action.

5. Tips

- Save the credentials of clients that you report on each month. Then you do not need to enter them again. They stay in your browser only. Click the pencil icon to update a renewed secret. Click the bin icon to remove a client.
- The report period can be any date range, not only a calendar month. Month-on-month comparison uses the calendar month of the To date. Run the reports of a client for consecutive months.
- If a metric does not show, refer to the troubleshooting table in the Setup Guide. The cause is almost always a permission or admin consent that is not there.
- The overseas sign-in check does not flag Australia, New Zealand and Malaysia, because they are expected travel destinations. It flags only unusual countries.
- The report always shows live data from the moment that you click Pull Intune data. There is no cache. The app keeps only a small set of summary figures between runs, for month-on-month comparison. These are device counts, Secure Score and similar values. The app keeps no raw tenant data and no credentials. It holds the figures for up to 13 months.
- Executive Summary, Ticketing & Support, and Recommendations & Opportunities are manual-entry sections. The wizard does not collect their fields, so the report leaves them out.
- Month-on-month comment starts with the second report of a tenant. The first report only saves the first figures. Leave One-off report unticked for clients that you report on each month. Tick it for prospects.
- Click MSP Monthly Report Builder in the top bar to go back to the start page. This clears a report that you did not export.

6. Troubleshooting

Symptom	What to check
"Connection failed: Unexpected token '<'"	The Netlify function returned an error page, not JSON. Usually the deployed site does not have the docx npm package, or Netlify site password protection is on. Site password protection blocks function calls.
Authentication failed	Make sure the Tenant ID, Client ID and Client Secret are correct. Make sure the secret did not expire.
A whole section is empty	A required Graph API permission is not there, or admin consent was not given. Refer to the permissions table in the Setup Guide.
Licence names show as GUIDs	Make the report again. The internal name list can miss a new licence SKU.
Report seems slow to load	This is normal for large tenants (500 or more users or devices). The sign-in log query can take longer.
No Month-on-Month Changes section	This is expected on the first report of a tenant, if the previous calendar month was not run, or if One-off report was ticked. Run consecutive months with the box unticked.
Upcoming licence renewals says data unavailable	The app needs Organization.Read.All with admin consent. This is the same permission as for licence counts. The lookup can also time out. Pull the data again.
SharePoint total doesn't match the SharePoint admin center	This is expected. The figures come from the Microsoft usage report, which is 24 to 48 hours behind. It includes hidden Teams-channel and system sites that the Active sites list hides. The type breakdown shows the difference.
Teams channels shows 0 but the client uses private channels	Open the Diagnostics panel above the report. It lists the raw template values that Microsoft returned. If no channel template (Team Channel) shows there, the Microsoft usage report does not list those sites for that tenant. Send the template list to the developer.
Overseas sign-ins: “N of M days checked” or a “Sign-in history limit” note	Microsoft slows or limits the sign-in log, and keeps it for only 30 days (7 days on free tenants). The Diagnostics panel shows how each date slice went. Pull the data again. For a period older than 30 days, the limit cannot be avoided. If it fails again and again for one client, tick Skip the overseas sign-in check on that saved client.
Risky users shows N/A	Microsoft Entra ID Protection needs Entra ID P2 (included in Microsoft 365 E5), or the lookup failed in this run. The report shows N/A and a note, not a false no-risky-users result. Month-on-month does not compare this figure until it is available again.
Hundreds or thousands of overseas sign-ins from one country	This is usually a company VPN or gateway. The report automatically excludes an overseas IP address that five or more different people use. It says how many sign-ins it left out. The Diagnostics panel lists those addresses.
Report shows last month, not this month	This is by design. The dates default to the last full calendar month. Change From and To on the Report details step for a different period.
The sign-in box appears, or “Please sign in with Microsoft”	Your 8-hour session ended, or you are not signed in. Click Sign in with Microsoft and use your Integricity account. Then do the step again. Sign in before you enter the details of a client, because sign-in reloads the page. A Sign-in was refused message means the account is not an Integricity staff account, or the app does not give it access. Ask the Integricity service desk lead.

Symptom	What to check
A yearly licence shows as Monthly	Microsoft does not give the billing frequency. The report shows Annual only when the dates clearly show a yearly term. Check the Microsoft 365 admin centre for the true billing of that licence.
	For an issue that this guide does not cover, contact Integricity Technology support. Send a screenshot of the error message and the approximate size of the tenant (number of devices and users).
