IT Health Snapshot

Setup Instructions

Step-by-step technical setup for your Microsoft 365 / Intune security and device posture snapshot

Overview

This guide walks through the technical setup needed to run your IT Health Snapshot -- a one-time, read-only review of your Microsoft 365 tenant's device management (Intune) and security configuration. Setup takes about 10-15 minutes and must be done by whoever holds Global Administrator (or Privileged Role Administrator) access in your tenant.

For a plain-language explanation of what data this involves, why we need it, and the authorization we ask you to sign beforehand, see the accompanying Data Access & Authorization document.

Prefer we set this up for you?

If you would rather not carry out the steps below yourself, we can do this setup on your behalf instead, using one of the following:

- Temporary elevation via Privileged Identity Management (PIM), if your tenant has PIM configured - you approve a time-limited activation of the necessary role for one of our engineers, who then completes the setup and lets the elevation expire on its own
- A temporary admin account or role assignment created for us directly, which you then remove once the setup is complete

Either way, any access granted to us is temporary and used only to complete this setup - it is removed or expires immediately afterward, and it is entirely separate from the ongoing read-only access the report itself uses (described below and in the Data Access & Authorization document). Let your Integricity contact know if you would like to go this route instead of following the steps yourself.

If you would like to set this up yourself, please follow the below steps:

Step 1: Register an app in Entra ID

- Go to entra.microsoft.com (or portal.azure.com > Microsoft Entra ID) and sign in with a Global Administrator account
- In the left-hand menu, select Identity > Applications > App registrations
- Click "+ New registration"
- Name: something recognisable, e.g. "Integricity IT Health Snapshot"
- Supported account types: leave the default - "Accounts in this organizational directory only (Single tenant)"
- Redirect URI: leave this blank - it is not required
- Click "Register"
- On the app's Overview page, copy and save the "Application (client) ID" and "Directory (tenant) ID" shown there - you will need both shortly

Step 2: Grant the required API permissions

- In the app's left-hand menu, click "API permissions"
- Click "+ Add a permission", then select "Microsoft Graph"
- Choose "Application permissions" - not "Delegated permissions"
- Use the search box to find and tick each of the 12 permissions listed below, clicking "Add permissions" once selected (you will likely need to repeat this search-and-add step a few times to get through all 12)

```
DeviceManagementManagedDevices.Read.All
DeviceManagementConfiguration.Read.All
DeviceManagementApps.Read.All
Policy.Read.All
SecurityEvents.Read.All
IdentityRiskyUser.Read.All
AuditLog.Read.All
User.Read.All
Reports.Read.All
Organization.Read.All
Group.Read.All
RoleManagement.Read.Directory
```

- Once all 12 appear in the permissions list, click "Grant admin consent for [your organisation]" near the top of the page and confirm
- Check every row now shows a green "Granted" status under Status - if any don't, click Grant admin consent again

Missing even one of these will cause the corresponding section of your report to come back empty rather than fail outright, so it is worth double-checking all 12 show as granted before continuing.

Step 3: Create a client secret

- In the app's left-hand menu, click "Certificates & secrets"
- Under the "Client secrets" tab, click "+ New client secret"
- Description: something recognisable, e.g. "IT Health Snapshot - one-time use"
- Expires: choose "Custom" and set an end date about a week away - the shortest practical window. If Custom isn't offered, pick the shortest preset available
- Click "Add"
- Immediately copy the value shown under "Value" (not the "Secret ID") - this is your Client Secret, and it is only ever shown once

Step 4: Send your credentials to run the report

- Send the Tenant ID and Client ID to your Integricity contact
- Your details are not stored on any Integricity server or written to any log - they are used only to make the requests needed for your report

Important: send the Client Secret separately from the Tenant ID and Client ID, through a secure channel - for example a password manager sharing link, an encrypted note, or read aloud over a phone call - never in the same email, chat message, or document as the other two values. Anyone who obtains all three together can access your tenant's data for as long as the secret remains valid, so keeping them apart in transit matters even though the exposure is short-lived.

Once we have all three values, your report is typically ready within a few minutes and will be sent back to you as a PDF.

Step 5: Clean up afterward

- Once your report has been generated, delete the app registration (or at minimum revoke the client secret) in Entra ID
- This closes off the read access you granted - it is not needed again unless you request another report

Questions or issues during setup?

Contact your Integricity Technology representative - we are happy to walk through it live if that is easier.
